IaaS

Infrastructure as a Service (IaaS) is a solution offering compute, storage and networking resources delivered as an on-demand service. It offers a highly flexible and scalable infrastructure for your organization's needs. CDW's customers have seen increased organizational agility from the rapid scalability that IaaS solutions provide while moving to a far more predictable cost structure that can adapt to seasonal or unpredictable IT resource demands. In today's highly competitive landscape, the benefits of IaaS can be critical to the success of the overall organization.

CDW partners with proven and reliable IaaS providers in the industry, with access to hundreds of data centers, and has the experience to guide you through your decision between cloud and traditional on-premises solutions or a combination of the two.

Some of our partners include:

AT&T, CoSentry, Navisite, nScaled, PeakColo, QTS, Savvis, SunGard, Terremark, ViaWest and Windstream

Back Up

Data protection is critical to the success of every organization, yet traditional backup solutions can be slow and difficult to manage. CDW provides partners with reliable resource pooling, elasticity and network access for cloud-based alternatives to offsite data storage.

Disaster Recovery

Making sure that your critical data, applications and systems are protected and quickly recoverable in the event of a disaster or outage is paramount. CDW offers quick and cost-effective partner solutions.

Only a small portion of disaster recovery events are due to natural disasters. Events include:

1% – Natural disasters.

13% – Unplanned occurrences such as application failures or operator error.

87% – Planned occurrences such as maintenance windows and routine updates.*
